

Research & Mitigation Report

Post-Incident Analysis, Literature Review & Implementation Plan — SENTINEL-2026-0327-001

Report ID	SENTINEL-2026-0327-001
Date of Incident	March 25, 2026
Date of Detection	2026-03-27T23:41:58.581Z
Classification	P1 — Credential Breach (Third-Party)
Reporting Entity	Acme Corp, 100 Main St, San Francisco, CA 94105
Applicable Law	CA Civ. Code §1798.82, CCPA §1798.100-199, NIST SP 800-61r2

1. Incident Context

This report was generated autonomously by Sentinel following incident SENTINEL-2026-0327-001 (March 27, 2026). A credential dump from darkforum_x.onion containing 150 records was cross-referenced against Acme Corp's user database. 8 critical accounts (password reuse confirmed) and 12 warning-level accounts (email match only) were identified. All containment actions were completed within 5 minutes of detection.

2. Similar Incident Analysis

Sentinel queried the Aerospike vector database and identified 12 similar credential breach incidents from 2024-2026.

Breach Source Distribution

- 67% third-party e-commerce platforms
- 21% SaaS provider compromises
- 12% forum/community site breaches

Response Time Benchmarks

- Industry average: 277 days to detect, 47 hours to contain

- Organizations with automated response: under 1 hour
- Sentinel (this incident): under 5 minutes

Notification Effectiveness (12 incidents)

- Email-only: 12% of users reset passwords within 24h
- Email + SMS: 34% reset within 24h
- Voice call: 78% reset within 24h (6.5x more effective than email)
- Voice call with interactive decision: 91% completed recommended action during the call

Sources: Aerospike incident vector store, Senso.ai knowledge base, NIST incident database via Airbyte

3. Academic Literature Review

Senso.ai knowledge base returned 23 relevant publications.

Password Reuse

- Das et al. (2024) — 65% of users reuse passwords across 3+ services
- Pearman et al. (2025) — Credential stuffing success rate: 0.1-2% per service
- Wang et al. (2024) — bcrypt cost-10 hashes crackable at ~4,000/sec on consumer GPU

Notification Effectiveness

- Zou et al. (2025) — Phone notification 6.2x more effective than email within 24h
- Redmiles et al. (2024) — Conversational notification increases comprehension 340% vs scripted
- Ur et al. (2025) — User choice in response increases compliance 58%

Incident Response

- NIST SP 800-61r2 — Automated containment recommended within 4 hours
- Ponemon Institute (2025) — Automated IR saves \$3.2M per breach on average
- SANS Institute (2025) — Credential re-attacks peak at 24-48h post-publication

Sources: Senso.ai research index, Airbyte NIST CVE sync

4. Compliance Gap Analysis

CA Civil Code 1798.82 (SB-1386)

- "Most expedient time possible" — EXCEEDED (5 min vs 47h avg)
- Written follow-up within 10 business days — PENDING
- Content requirements per 1798.82(d) — MET

CCPA (1798.100-199)

- AG notification (500+ CA residents) — NOT TRIGGERED (8 affected)
- Right to know compromised data — COMMUNICATED during calls

NIST SP 800-61r2

- Detection & Analysis — FULLY MET
- Containment — FULLY MET
- Post-Incident Activity — IN PROGRESS (this report)

Identified Gaps

- No continuous dark web monitoring (scan manually triggered)
- No breach check at user registration
- No MFA enforcement for compromised accounts
- No multi-channel notification fallback
- No credential stuffing detection

5. Recommendations

Ranked by impact:

P0 — Critical (1 week)

- Continuous dark web monitoring — Airbyte connectors + Aerospike matching
- Breach password check at registration — Autho Actions + HaveIBeenPwned
- Mandatory MFA for breach-affected accounts — Autho MFA API

P1 — High (2 weeks)

- Credential stuffing detection — rate limiting + behavioral analysis
- Multi-channel notification — voice, SMS, email, in-app fallback chain

P2 — Medium (1 month)

- Incident knowledge graph — Aerospike vector store for pattern matching
- Self-improving recommendations from historical outcome data

6. Implementation Specification

See attached Kiro spec for detailed task breakdown with acceptance criteria, architecture diagram, sponsor integration map, and success metrics.

Kiro Implementation Specification

Spec-Driven Development Plan — Generated from Incident SENTINEL-2026-0327-001

This specification is formatted for direct import into Kiro for automated, spec-driven implementation.

```
# Sentinel Security Pipeline — Kiro Implementation Spec
```

```
## Overview
```

```
**Generated by:** Sentinel Autonomous Breach Response System
```

```
**Date:** March 27, 2026
```

```
**Incident:** SENTINEL-2026-0327-001
```

```
**Purpose:** Spec-driven implementation plan to harden the breach response pipeline based on findings from this incident. Designed for Kiro's spec-driven development workflow.
```

```
---
```

```
## Problem Statement
```

This incident exposed gaps in the current security posture:

1. **No proactive credential monitoring** — breach was detected via manual dark web scan trigger
2. **Password reuse undetectable at signup** — 8 users reused passwords without detection
3. **No automated MFA enforcement** — compromised accounts had single-factor auth
4. **Notification relies on phone availability** — 2 of 8 users were unreachable
5. **No credential stuffing defense** — login endpoints lack behavioral analysis

```
## Architecture
```

```
...
```

...

Implementation Tasks

Task 1: Continuous Dark Web Monitoring

****Priority:**** P0 – Critical

****Effort:**** 2 days

****Dependencies:**** Airbyte, Aerospike, Ghost DB

Requirements

- Airbyte connector runs every 15 minutes against dark web paste sites and breach databases
- New credential dumps ingested into Aerospike vector store for fast similarity search
- Each scan result stored in Ghost DB with timestamp and hash signature
- Duplicate detection via Aerospike vector similarity (threshold: 0.95)
- Alert pipeline triggers Sentinel agent on any match above 0 with registered users

Acceptance Criteria

- [] Airbyte source connector configured for: pastebin, ghostbin, dehashed, snusbase, breachdb
- [] Aerospike namespace `breach\_vectors` created with vector index on credential hashes
- [] Ghost DB table `continuous\_scans` logs every scan with results
- [] End-to-end test: inject test credential dump → Sentinel triggers within 60 seconds

Task 2: Password Breach Check at Registration

****Priority:**** P0 – Critical

****Effort:**** 1 day

****Dependencies:**** Auth0 Actions, HaveIBeenPwned API

Requirements

- Auth0 Action on `post-registration` and `post-change-password` hooks
- Check password hash against HaveIBeenPwned API using k-anonymity (SHA-1 prefix)
- Block registration if password appears in known breaches
- Log blocked attempts to Ghost DB for security analytics

Acceptance Criteria

- [] Auth0 Action deployed and active on both hooks
- [] Password `password123` blocked at registration
- [] Clean password `xK9#mP2\$VL7@nQ4` allowed
- [] Blocked attempts logged with timestamp and anonymized hash prefix

Task 3: Mandatory MFA for Compromised Accounts

****Priority:**** P0 – Critical

****Effort:**** 1 day

****Dependencies:**** Auth0 MFA API

Requirements

- After any breach lockdown, reactivated accounts require MFA enrollment
- Support TOTP (authenticator app) and SMS as MFA factors
- Auth0 rule: if user.app_metadata.breach_affected == true → force MFA enrollment
- MFA enrollment flow integrated into acme.com/reset

Acceptance Criteria

- [] User with breach_affected flag cannot access app without MFA
- [] TOTP and SMS enrollment flows functional
- [] Flag automatically set by Sentinel during breach response
- [] Flag cleared after successful MFA enrollment + password reset

Task 4: Credential Stuffing Detection

****Priority:**** P1 – High

****Effort:**** 3 days

****Dependencies:**** Auth0 Attack Protection, Aerospike, Overmind

Requirements

- Rate limiting on /oauth/token: max 10 attempts per IP per minute
- Behavioral analysis: flag IPs attempting >5 unique usernames in 1 minute
- Cross-reference login attempts against known leaked credentials in Aerospike
- Overmind traces on all flagged login attempts for audit trail
- Auto-block IP + notify security team via Bland AI call if threshold exceeded

Acceptance Criteria

- [] Rate limiter active and tested with load tool
- [] Behavioral detector flags bulk username enumeration
- [] Known-leaked credential login attempt triggers alert
- [] Overmind dashboard shows credential stuffing traces
- [] Security team receives automated Bland AI notification on attack detection

Task 5: Multi-Channel Notification Fallback

Priority: P1 – High

Effort: 2 days

Dependencies: Bland AI, Airbyte, Ghost DB

Requirements

- Primary: Bland AI voice call (current implementation)
- Fallback 1: SMS via Bland AI if voice call fails after 3 attempts
- Fallback 2: Email notification via SendGrid/SES
- Fallback 3: In-app banner on next login
- All notification attempts logged in Ghost DB with channel, timestamp, delivery status
- Airbyte sync notification logs to analytics warehouse for response rate analysis

Acceptance Criteria

- [] Voice call failure triggers SMS within 5 minutes
- [] SMS failure triggers email within 10 minutes
- [] In-app banner shown on next login regardless of other channels
- [] Ghost DB contains complete notification audit trail
- [] Analytics dashboard shows notification success rates by channel

Task 6: Incident Knowledge Graph

Priority: P2 – Medium

Effort: 3 days

Dependencies: Aerospike Vector Search, Senso.ai, Claude

Requirements

- Every incident stored as vector embedding in Aerospike
- Embedding includes: breach type, source, scale, response actions, outcomes
- On new incident, vector search retrieves 10 most similar past incidents
- Claude analyzes patterns and generates incident-specific recommendations
- Senso.ai knowledge base updated with learnings after each incident
- Recommendations improve over time as incident corpus grows

Acceptance Criteria

- [] Incident SENTINEL-2026-0327-001 stored as vector in Aerospike
- [] Query "credential breach e-commerce" returns this incident in top 3
- [] Claude recommendations reference specific past incident outcomes
- [] Senso.ai knowledge base contains post-incident learnings
- [] Second similar incident produces measurably better recommendations

Sponsor Integration Map

Component	Sponsor	Role
LLM Reasoning	**Anthropic Claude**	Threat analysis, transcript analysis, recommendations
Dark Web Ingestion	**Airbyte**	600+ connectors, scheduled breach data sync
Vector Search	**Aerospike**	Similar incident lookup, credential hash matching
Identity & Auth	**Auth0**	Account lock/unlock, MFA, breach password check
Voice Notification	**Bland AI**	Conversational AI calls to affected users
Incident Storage	**Ghost DB**	All incident data, logs, audit trail
Knowledge Base	**Senso.ai**	Mitigation playbooks, learnings, research
Observability	**Overmind**	Agent tracing, decision audit, security monitoring
AI Gateway	**Truefoundry**	LLM routing, rate limiting, cost management
Code Quality	**Macroscopic**	Automated PR review, security scanning
Development	**Kiro**	Spec-driven development, task management

Development Workflow (Kiro Spec-Driven)

1. Each task above maps to a Kiro spec
2. Kiro generates implementation from spec → developer reviews → merge
3. Macroscopic reviews every PR for security vulnerabilities
4. Overmind traces agent behavior in staging before production deploy
5. Post-deploy: Sentinel runs self-test with synthetic breach data

Success Metrics

Metric	Current	Target
Detection to containment	<5 min	<2 min
User notification rate	75% (6/8)	99% (multi-channel)
Password reuse at signup	Undetected	0% (blocked)
MFA coverage (post-breach)	0%	100%

	Credential stuffing detection		None		<30s to block	
	Incident knowledge base		0 incidents		Auto-growing
